

There are some places that need to remain "quiet zones", i.e. hospitals, libraries and airplanes. The interior of an airplane is only about 8 feet wide and this causes sound to travel differently than in a normal environment. As a flight attendant, I have turned to respond to a voice, only to discover that the voice had travelled from the back of the aircraft. Imagine a plane full of people all talking at the same time. Also, enclosed spaces are not a place for conversations that are offensive. I certainly don't want to have to "police" calls of a sexual nature. Please do not add fuel to an already ignitable cabin full of people.
